

2014 DRINKING WATER QUALITY REPORT

LYNNFIELD CENTER WATER DISTRICT, LYNNFIELD, MASSACHUSETTS

PWS ID# 3164000

Compliance with Safety and Health Standards

The Lynnfield Center Water District's (the District's) water meets and exceeds all state and federal standards. We test our water regularly through a certified laboratory. During 2014, we collected more than 1,600 water samples in the system that were then

tested for compliance with state and federal health standards. State and federal regulators routinely monitor our compliance and testing protocols to assure that we deliver safe drinking water to our customers.

Important Drinking Water Information

All sources of drinking water (both tap water and bottled water) including rivers, lakes, streams, ponds, reservoirs, springs, and wells contain some naturally occurring contaminants or substances. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk.

More information about contaminants and potential health affects can be obtained by calling the Environmental Protection Agency's (EPA's) Safe Drinking Water Hotline (1-800-426-4791). In order to ensure that tap water is safe to drink, the Massachusetts Department of Environmental Protection (DEP) and EPA prescribe regulations that limit the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration (FDA) and the Massachusetts Department of Public Health (DPH) regulations establish limits for contaminants in

bottled water that must provide the same protection for public health. This report provides you with information about the contaminants found naturally in your drinking water, the levels at which they were found, and the likely source of each contaminant.

Contaminants that may be present in source water include:

- *Microbial contaminants*, such as viruses and bacteria, may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife.
- *Inorganic contaminants*, such as salts and metals, can be naturally-occurring or result from urban stormwater runoff, industrial, or domestic wastewater discharges, oil and gas production, mining and farming.
- *Pesticides and herbicides* may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- *Organic chemical contaminants* include synthetic and volatile organic chemicals that are by-products of industrial processes and petroleum production and can also come from gas stations, urban stormwater runoff and septic systems.
- *Radioactive contaminants* can be naturally-occurring or be the result of oil and gas production and mining activities.

2014 Drinking Water Report

This report describes the Lynnfield Center Water District's drinking water sources and treated water quality for calendar year 2014, and programs that protect the high quality of our water supply.

This publication is mandated by the federal public-right-to-know regulation requiring community water suppliers to provide specific treated water quality information annually to their customers.

This report includes additional information beyond the minimum federal requirements in order to respond to typical questions our customers ask about the District's water system.

Vulnerability

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/Center for Disease Control guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline 1-800-426-4791.

Customer Views Welcome

If you are interested in learning more about Lynnfield Center Water District's water supply system, water quality and other related information please contact the District by calling 781-334-3901. The District's Board of Water Commissioners meets bi-monthly at the District's offices.

2014 Treated Water Quality Data

Listed below are 18 substances detected in the Lynnfield Center Water District's drinking water during 2014. The District also does additional testing well beyond what is required by federal and state regulations. Not listed are more than 100 other substances for which we tested that were not detected during 2014, including comprehensive testing for pesticides and herbicides.

Substance	Highest Detected Levels	Range of Detected Levels	Highest Level Allowed (MCL)	Ideal Goal (MCLG)	Source of Contamination
Regulated at the Water Supply Wells					
Barium ¹	0.039 ppm	0.027 – 0.039 ppm	2 ppm	2 ppm	Discharge of drilling wastes, discharge from metal refineries, erosion of natural deposits.
Chromium ¹	2 ppb	ND – 2 ppb	100 ppb	100 ppb	Discharge from pulp mills, erosion of natural deposits.
Fluoride ²	1.7 ppm	ND – 1.7 ppm	4 ppm	4 ppm	Water additive that promotes strong teeth, erosion of natural deposits, discharge from fertilizer and aluminum factories
Gross Alpha	3.2 pCi/L	2.0 – 3.2 pCi/L	15 pCi/L	0 pCi/L	Erosion of natural deposits
Nitrate as Nitrogen	9.3 ppm	0.67 – 9.3 ppm	10 ppm	10 ppm	Runoff from fertilizer use; Leaching from septic systems; Erosion of natural deposits
Perchlorate	0.15 ppb	ND – 0.15 ppb	2 ppb	N/A	Rocket propellants, fireworks, munitions, flares, blasting agents
Radium (Combined)	0.2 pCi/L	0.0 – 0.2 pCi/L	5 pCi/L	0 pCi/L	Erosion of natural deposits
Disinfectants and Disinfection By-Products					
Free, Total or Combined Chlorine ³	0.40 ppm	0.09 – 0.97 ppm	4 ppm (MRDL)	4 ppm (MRDLG)	Water additive used to control microbes
Total Trihalomethanes ³	21.6 ppb	11 – 32.3 ppb	80 ppb	0 ppb	By-product of drinking water chlorination
Haloacetic Acids ³	4.30 ppb	2.88 – 5.72 ppb	60 ppb	0 ppb	By-product of drinking water chlorination
Unregulated Contaminants⁴					
Bromoform	2.78 ppb	1.09 – 2.78 ppb	not regulated	not regulated	Component of total trihalomethanes
Bromodichloromethane	8.76 ppb	2.85 – 8.76 ppb	not regulated	not regulated	Component of total trihalomethanes
Chlorodibromomethane	0.80 ppb	0.55 – 0.80 ppb	not regulated	not regulated	Component of total trihalomethanes
Dibromochloromethane	14.2 ppb	4.3 – 14.2 ppb	not regulated	not regulated	Component of total trihalomethanes
Chloroform	6.53 ppb	2.73 – 6.53 ppb	not regulated	not regulated	Component of total trihalomethanes
Manganese ^{5,6}	0.15 ppb	ND – 0.15 ppb	not regulated	not regulated	Erosion of natural deposits
Sodium ⁷	10.8 ppm	9.7 – 10.8 ppm	not regulated	not regulated	Present in natural water (source water)
Sulfate ⁵	23.9 ppm	12.6 – 23.9 ppm	not regulated	not regulated	Erosion of natural deposits (source water)
Substance	Highest Detected Levels ⁸	Range and Number of Sites Above Action Level (AL)	Action Level (AL)	Ideal Goal (MCLG)	Source of Contamination
Regulated at the Customer's Tap					
Copper	0.76 ppm	0.07 – 1.0 ppm 0 results > AL	1.3 ppm AL	1.3 ppm	Corrosion of household plumbing systems, erosion of natural deposits, leaching from wood preservatives
Lead	4 ppb	ND – 7 ppb 0 result > AL	15 ppb AL	0 ppb	Corrosion of household plumbing systems, erosion of natural deposits

Definitions:

Maximum Contaminant Level (MCL) – The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLG's as feasible using the best available technology.

Maximum Contaminant Level Goal (MCLG) – The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLG's allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) – The level of a drinking water disinfectant below which there is no known expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Action Level (AL) – The concentration of a contaminant which if exceeded, triggers treatment or other requirements that a water system must follow.

90th percentile – Out of every 10 homes sampled, 9 were at or below this level.

Massachusetts Office of Research and Standards Guideline (ORSG) – This is the concentration of a chemical in drinking water, at or below which, adverse health effects are unlikely to occur after chronic (lifetime) exposure. If exceeded, it serves as an indicator of the potential need for further action. See: www.mass.gov/dep/about/organization/orshist.htm for more information.

Secondary Maximum Contaminant Level (SMCL) – These standards are developed to protect the aesthetic qualities of drinking water and are not health based.

Key to Abbreviations:

ND – Not detected

ppm (Part Per Million) – One part per million is the equivalent of \$1 in \$1,000,000.

ppb (Part Per Billion) – One part per billion is the equivalent of \$1 in \$1,000,000,000.

pCi/L – Picocuries per liter is a measure of the radioactivity in water. A picocurie is 10⁻¹² curies and is the quantity of radioactive material producing 2.22 nuclear transformations per minute.

< Less than

± Plus or minus, denoting a range

Footnotes:

¹ No monitoring for these substances was conducted in 2014 because it was not required. Detected results for Barium and Chromium are from sampling conducted in 2012.

² EPA's MCL for fluoride is 4 ppm. However, our state has set a lower MCL, 2 ppm, to better protect human health.

³ Highest chlorine level is based on the running annual average of data. Highest trihalomethanes and haloacetic acid levels are based on the highest quarterly running annual average result. The ranges represent the individual results of all samples collected in 2014.

⁴ Unregulated contaminants are those for which there are no established drinking water standards. The purpose of unregulated contaminant monitoring is to assist regulatory agencies in determining their occurrence in drinking water and whether future regulation is warranted.

⁵ The SMCL for manganese is 50 ppb. The SMCL for sulfate is 250 ppm. [There is no applicable ORSG for manganese or sulfate].

⁶ EPA has established a lifetime health advisory (HA) of 300 ppb and a SMCL of 50 ppb for manganese to protect against concerns of potential neurological effects, and a 1-day and 10-day HA of 1,000 ppb for acute exposure.

⁷ The ORSG for sodium is 20 ppm (there is no applicable SMCL for sodium). Sodium sensitive individuals, such as those experiencing hypertension, kidney failure, or congestive heart failure, should be aware of the sodium levels where exposures are being carefully controlled.

⁸ Based on 90th percentile, as required by regulations. Results based on 20 samples.

Important Health Information

Nitrate: As shown in the table above, the highest detected level of nitrate was above 5 ppm (50% of the MCL), but below the MCL of 10 ppm. Nitrate in drinking water at levels above 10 ppm is a health risk for infants of less than six months of age. High nitrate levels in drinking water can cause blue baby syndrome. Nitrate levels may rise quickly for short periods of time because of rainfall or agricultural activity. If you are caring for an infant, you should ask for advice from your health care provider.

Lead: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Lynnfield Center Water District is responsible for providing

high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at 800-426-4791 or at <http://www.epa.gov/safewater/lead>.

Lynnfield Center Water District's Source Water Assessment Program

Where does my water come from? The Lynnfield Center Water District obtains its drinking water from four groundwater wellfields, as shown on the map. The Glen Drive wellfield contains four bedrock wells. The Main Street wellfield contains a single gravel packed well. There are two wellfields in the Phillips Road area: a tubular wellfield with 60 wells, and a bedrock wellfield with five wells.

In addition to the wellfields, the District operates two storage tanks, one at Knoll Road and one at Wing Road. The distribution system consists of approximately 48 miles of water mains ranging in size from 2- to 16-inch diameter.

How are these sources protected? The DEP has prepared a Source Water Assessment Program (SWAP) Report for the water supply sources serving the Lynnfield Center Water District. The SWAP report notes the key issues of: residential land uses and activities; presence of oil or hazardous material contamination sites; and comprehensive wellhead protection planning in the water supply protection areas. The report commends the Lynnfield Center Water District on its existing source protection measures, which include: posting "Public Drinking Water" signs; regular inspections of protection areas; prohibition of non-water-supply related activities within the protection area; development of an "Emergency Response Plan" to deal with spills or other emergencies; and regular inspections of commercial and industrial activities by the Board of Health.

What can be done to improve protection?

The SWAP report recommends:

- Educating residents on proper disposal of hazardous materials.
- Providing residents with information on environmentally friendly household products.
- Educating residents on septic system care.
- Educating residents on environmentally sound lawn care.

- Providing residents with educational materials on proper storage of liquid petroleum products in above ground storage tanks.
- Monitoring progress on ongoing remedial action conducted for known oil or hazardous material contamination sites.
- Developing a land acquisition plan.
- Coordinating efforts with local officials in North Reading and Peabody to compare existing controls.
- Developing and implementing an Inspection Program for facilities that generate, use, store, or dispose of hazardous/toxic materials.

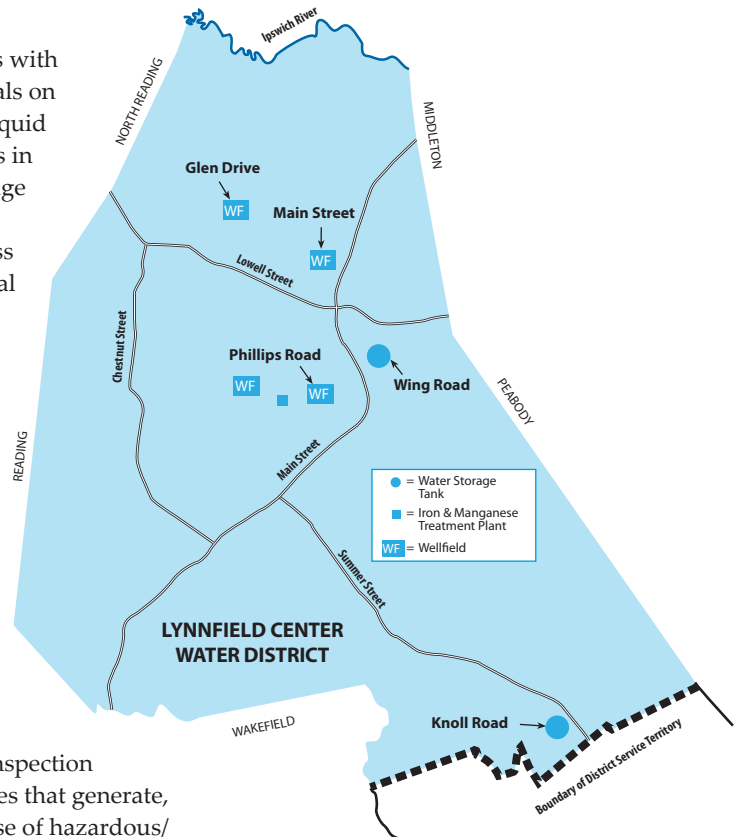

The Lynnfield Center Water District implements and monitors, as applicable, the above recommendations on an ongoing basis.

Residents can help protect sources by:

- Practicing good septic system maintenance.
- Supporting water supply protection initiatives at Town meetings.
- Taking hazardous household chemicals to hazardous materials collection days.
- Contacting the water department or Board of Health to volunteer for monitoring or education outreach to schools.
- Limiting pesticide and fertilizer use.

Water System's Susceptibility

The wells for the Lynnfield Center Water District are located within water supply protection areas. The primary recharge areas for the wells are predominantly forested and residential, with a small amount of recreational land use. The SWAP ranks susceptibility of wells by determining the presence of contamination threats within the well recharge areas. The SWAP ranks the Glen Drive wellfield susceptibility as

moderate since there is at least one moderate threat land use within the recharge area, and the Phillips Road and Main Street wells susceptibility as high since there is at least one high threat land use within the recharge area. Sources of moderate threats in the Glen Drive and the Phillips Road and Main Street recharge areas include potential contamination sources such as over-fertilization at golf courses, residential pesticide use/over-application, above ground storage tanks, water treatment sludge lagoons, improper residential fuel oil storage and malfunctioning septic systems. Sources of high threats in the Phillips Road and Main Street recharge area include potential contamination sources such as improper fluid and fuel handling at gas stations and improper handling of underground storage tanks.

Where can I see the SWAP Report?

The complete SWAP report is available at the Lynnfield Center Water District and online at www.mass.gov/eea/docs/dep/water/drinking/swap/nero/3164000.pdf. For more information, call the District at 781-334-3901.

Notice of Noncompliance

The District received a notice of noncompliance from MassDEP for failure to collect a microscopic particulate analysis (MPA) sample from the Phillips Road Water Treatment Plant during the Fall 2014 sampling period. We are required to monitor your drinking water for specific contaminants on a regular basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. During Fall 2014, we did not monitor or test for MPA and therefore cannot be sure of the quality of our drinking water during that time. MPA sampling will be completed during the Fall 2015. Please share this information with all the other people who drink this water, especially those who may not have received this notice directly (for example, people in apartments, nursing homes, schools, and businesses). You can do this by posting this notice in a public place or distributing copies by hand or mail.

Water Conservation

Due to the District's permitted withdrawal limit from the Ipswich River Water Basin, the District has had to implement water usage restrictions as required by DEP. The District is actively working to insure the long-term viability of its sources by aggressively promoting water conservation and identifying potential new water supply sources in town.

The average home can reduce inside water use by 18 gallons per capita per day (gpcd) or more.

Some ways to reduce usage include:

- Replace old toilets with low flush (1.6 gallon) and save 10.5 gpcd.
- Install low flow shower heads (2.5 gpm) and faucet aerators (2.2 gpm) and save 3.0 gpcd.
- Replace agitator type clothes washer with tumbler type and save 4.5 gpcd.

As much as 30 percent of water can be lost to evapotranspiration by watering the lawn during midday. We recommend the following tips to minimize outdoor water usage:

- Water between 5 P.M. and 9 P.M. avoid watering on windy days.
- A watered lawn will absorb moisture better when delivered in a few sessions spaced 30 minutes to an hour apart rather than one 30 minute session.

- To determine if a lawn needs watering, walk across the grass, if footprints are left, lawn needs watering.
- Install moisture sensors in each irrigation zone to better monitor irrigation needs.

Conserving water saves you money and preserves the District's water supply.

To promote water conservation, the District has a Rebate Program for residential water-savings devices. District customers that replace existing washing machines and/or toilets with eligible washing machines and/or low flow toilets are eligible for rebates. Also to promote water conservation the District has faucet aerators, low-flow shower heads and toilet displacement bottles/dams available to its customers at cost. Contact the District for more information or to obtain Rebate Application Forms, 781-334-3901.

Water Use Restrictions

Outside use of sprinklers is limited to even calendar days between 5:00 P.M. and 9:00 P.M. This restriction is necessitated by the Department of Environmental Protection permitted withdrawal from the Ipswich River Water Basin.

Cross Connection Control Program

A cross connection is a connection between a drinking water pipe and a polluted source. The pollution can come from your own home. For instance, you're going to spray fertilizer on your lawn. You hook up your hose to the sprayer that contains the fertilizer. If the water pressure drops (say because of fire hydrant use in the town) when the hose is connected to the fertilizer, the fertilizer may be sucked back into the drinking water pipes through the hose. Using an attachment on your hose called a backflow-prevention device can prevent this problem.

The Lynnfield Center Water District recommends the installation of backflow prevention devices, such as a low cost hose bib vacuum breaker, for all inside and outside hose connections. You can purchase this at a hardware store or plumbing supply store. This is a great way for you to help protect the water in your home as well as the drinking water system in your town!

Lynnfield's Drinking Water Treatment Process

Sodium hypochlorite (chlorine) is added in the treatment process and as a disinfectant to kill any germs that may be in the water and to ensure that the water in the distribution system remains safe to drink.

Fluoride is added to the water to reduce the incidence of dental cavities, particularly in children.

Potassium hydroxide (KOH) is mixed uniformly through the water to adjust pH and control corrosion of lead and copper from household plumbing fixtures.

2014 DRINKING WATER QUALITY REPORT

LYNNFIELD CENTER WATER DISTRICT, LYNNFIELD, MASSACHUSETTS
